Quick Assist, Without the Tech Panic

A plain-English guide for receiving safe remote help on Windows 10/11

What this guide is for

Use this when a trusted family member, friend, or tech helper needs to see your Windows computer screen and help you fix something remotely.

It explains what to click, what to avoid, and how to stop the session safely.

Important safety promise

Only use remote help with someone you trust AND only when you asked for help first.

Never give remote access to a surprise caller, text message, pop-up warning, or anyone asking for banking details, passwords, or 2-factor codes.

Version 1.0 - prepared June 2026

Not affiliated with Microsoft. Built as a plain-English helper guide.

1. The super quick version

This is the short version for someone who just needs to get started safely.

Done?	Check	Why it matters
[]	You asked for help first	Do not continue with surprise callers or scary pop-ups.
[]	Close private tabs and documents	The helper may be able to see your screen.
[]	Open Quick Assist	Press Ctrl + Windows key + Q, or search Quick Assist from Start.
[]	Enter the 6-digit code	Only use a code from the trusted helper you contacted.
[]	Select Allow to share your screen	This starts the viewing session.
[]	Allow control only if needed	You can cancel control if you feel uncomfortable.
[]	Select Leave when finished	This ends the remote help session.

Plain-English meaning

Quick Assist lets another person see your screen. If you approve full control, they can also move the mouse and type. That can be very useful, but it is also why you should only use it with someone you trust.

2. Before you start: safety checklist

- Make sure you contacted the helper first. Do not trust someone who randomly calls and says your computer has a problem.
- Close online banking, email, Centrelink/MyGov, medical portals, private photos, password managers, and anything else sensitive.
- Do not tell anyone your passwords, banking codes, card numbers, recovery codes, or 2-factor authentication codes.
- Keep your phone nearby in case you need to call the helper or stop the session.
- Remember: you can say no, cancel control, or leave the session at any time.

Red flag rule

If someone pressures you, rushes you, scares you, asks for money, or asks you to log in to banking while they watch - stop immediately. Close Quick Assist and contact someone you trust.

3. How to receive help

Use this section if someone you trust is helping you fix your computer.

1. Open Quick Assist. You can press Ctrl + Windows key + Q, or click Start and type Quick Assist.
2. Ask your helper for their 6-digit security code.
3. Type the code into the Code from assistant box, then select Submit.
4. When Windows asks if you want to share your screen, select Allow if you are ready.
5. If the helper requests full control, only select Allow if you are comfortable with them controlling your mouse and keyboard.
6. Watch what they are doing. Ask them to explain anything you do not understand.
7. When the help session is finished, select Leave.

Good sentence to use

“Please explain what you are clicking before you click it, so I know what is happening.”

4. How to give help

Use this section if you are the trusted helper assisting someone else.

1. Open Quick Assist on your Windows computer.
2. Select Help someone.
3. Share the 6-digit code with the person you are helping.
4. Wait for them to enter the code, allow the connection, and share their screen.
5. Use view-only mode first where possible. Request control only when it is actually needed.
6. Explain what you are doing in plain English before changing settings or deleting anything.
7. When finished, select Leave and remind them the session has ended.

5. Troubleshooting: when Quick Assist refuses to behave

Problem	Try this
Quick Assist is missing	Open Microsoft Store, search for Quick Assist, then install it. On some managed work or school devices, installation may be blocked.
Keyboard shortcut does nothing	Click Start, type Quick Assist, and open it from the search results.
WebView2 error appears	Microsoft says Quick Assist requires Microsoft Edge WebView2. Update Microsoft Edge first; if needed, install WebView2 from Microsoft.
The code has expired or does not work	Ask the helper for a fresh 6-digit code and try again.
The screen sharing prompt does not appear	Close Quick Assist on both computers and start again. Also check the internet connection.
The session feels unsafe	Select Leave, close Quick Assist, and contact someone you trust.

6. Helper script: what to say to a nervous person

- “I am going to help you through Quick Assist. You stay in control.”
- “Close anything private first, like banking or email.”
- “I will give you a 6-digit code. Do not accept codes from anyone else.”
- “When it asks to share your screen, click Allow only if you are ready.”
- “I will explain what I am doing before I change anything.”
- “You can stop this anytime by clicking Leave.”

Mini policy for helpers

Do not ask for banking details, passwords, 2-factor codes, private documents, or unnecessary access. The safest remote help session is boring, calm, explained clearly, and easy to end.

7. Printable customer checklist

Done?	Check	Why it matters
☐	I asked this person for help first	Stops surprise remote access scams.
☐	I know who I am talking to	Only trust a known helper or verified support channel.
☐	I closed private windows	The helper may be able to see your screen.
☐	I will not share passwords or codes	Good helpers do not need your private security codes.
☐	I know where Leave is	You can end the session anytime.
☐	The session is finished	Select Leave and check that Quick Assist is closed.

8. Notes for Dolan Friendly Services

Use this space to write what was fixed, what was changed, and any follow-up steps.
